

PRESENTATION FOR SPACE DEBRIS REMEDIATION (2016-2021)

DON'T KILL ISS save funds and lives

Glycan SpaceXR-Heliotorr is involved in the ISS protection since 2016 with future TERMINATORR Plasma machines

We need an industrial tool (patented) in order to treat at minimum 600 objects (on place) per year without any risks .

This tool is named TERMINATORR.

The recent risk created by the destruction of Russian satellite might compromise the ISS and astronauts

We want to use "modern tools" in order to fix this present risk and future menace.

We are not competitors to others companies, they can hunt and capture the defunct or dangerous satellites , we will terminate on place the menace for ever.
